

FilaMar Energy Services *First and Only* Carbon Neutral Last Mile Logistics Company

100+ CNG Trucks NOW IN SERVICE; Largest Clean Energy Truck Fleet in the Industry

HOUSTON (April 4, 2022) – FilaMar Energy Services continues its long-standing tradition of creating innovative solutions in the oil and gas logistics industry by becoming certified by Carbonfund.org as Carbonfree®. As the first and only certified carbon neutral last mile logistics company, FilaMar allows customers to substantially reduce their supply chain’s environmental impact with the most environmentally friendly logistics and CNG sand transportation.

“Our Carbonfree® Logistics Service will support customers who want to further decrease their environmental footprint,” said Lambert Arceneaux, Chief Executive Officer of FilaMar Energy Services. “No other transportation fuel so far is as environmentally sustainable and adaptable as natural gas and none more than natural gas has more of a direct and immediate impact on CO2 emissions today. This designation strengthens our position and our mission to lead the way to creating real and actual change in our industry.”

In December 2021, FilaMar announced its recent purchase of +100 Compressed Natural Gas (CNG) trucks will complement its existing CNG fleet providing it with the scale necessary to service some of its core key clients, namely Chesapeake Energy and Ovintiv. The additional trucks are now in service marking the largest fleet of CNG truck in the frac sand logistics industry.

“This has been in the making for quite some time now,” said Bill Schmid, CFO of FilaMar Energy Services. “The need for clean energy transportation is no longer something people can just talk about in marketing campaigns. We saw the increased emphasis on ESG compliance coming more than a year ago prompting our initial CNG trucking investment. This larger purchase positions us to stay ahead of the game. In short, we believe that we offer one of the best near-term environmentally beneficial trucking solutions with scale to help reduce the industry’s carbon footprint and to meet the ‘carbon neutral’ goals placed on the industry by the governmental and regulatory bodies.”

Environmental, Social and Corporate Governance (ESG) is here to stay. It is singularly becoming the leading factor in influencing how companies operate. When one thinks CNG, they should consider the following:

- Every diesel truck replaced with a CNG unit equates to a reduction of +/-325 cars off the road. This is an average reduction of +8,000 gallons, equivalent of 14 metric tons of greenhouse gases (GHG)
- In a recent trucking CNG case study, a large trucking company stated that it displaced more than 1 million diesel gallon equivalents on +200 trucks reducing green-house gases by 1,100 tons per year

- Heavy duty vehicles total only seven percent of all vehicles on America's roadways, yet they account for upwards of 50 percent of all smog-precursor emissions and 20 percent of all transportation-related GHGs,
- CNG vehicles are 90% cleaner than the EPA's current NOx standard and emit up to 21% fewer Green House Gas (GHG) emissions than comparable gasoline and diesel vehicles

The Fila Group is a Houston based environmentally focused full service frac sand logistics business with an 11-year track record of consistently delivering the highest quality trucking, sand, and onsite services for frac sand delivery from the mine to the well head. Our diverse customer base includes many of the well-recognized oil field service and exploration and production companies operating in the oil shale business. www.filamarenergy.com
